PRACTICE WRITING 2 - RESEARCH PAPER

Traditional Press in Vietnam Is Hard to Compete with the Big Four GAFA

A quantitative, hypothesis-driven analysis of audience, advertising and platform scale, 2021-2025

Research paper | APA 7th edition referencing

Abstract

This paper evaluates the hypothesis that traditional press in Vietnam is hard to compete with the big four GAFA - Google, Amazon, Facebook/Meta and Apple - by combining quantitative indicators from 2021-2025 with a market-structure interpretation. The analysis uses internet adoption, platform advertising reach, GAFA financial data, estimates of the Vietnamese digital advertising market, traditional press and broadcasting revenue, and the 2024 press digital-transformation maturity assessment. The method is descriptive rather than causal: percentage change, compound annual growth rate, index numbers and comparative scale are used to test whether independent indicators point in the same direction. The evidence is strongly consistent with the hypothesis. Vietnam reached 79.8 million internet users in early 2025; Facebook's potential advertising reach was 76.2 million and YouTube's 62.3 million. The estimated Vietnamese digital advertising market rose from US$903 million in 2021 to US$1.47 billion in 2025, while total newspaper/magazine revenue fell 14.9% and radio/television revenue fell 39.7% from 2022 to 2024. Over 2021-2025, Alphabet's Google advertising revenue increased 40.7%, Meta advertising 70.7%, Amazon advertising services 120.3%, and Apple Services 59.5%. The conclusion is not that GAFA caused every decline in Vietnamese traditional media, but that platform scale, data capabilities, advertising technology, ecosystem control and investment capacity create a persistent competitive disadvantage for conventional press business models.

Keywords

Vietnam; traditional press; GAFA; digital advertising; platformization; media economics; audience; digital transformation

1. Introduction: Research Problem and Hypothesis

The economics of journalism historically depended on a bundle of advantages: ownership of scarce distribution channels, recognizable brands, advertising access and relatively stable audience habits. Digital platforms weaken several of these advantages at the same time. Search engines and social feeds mediate discovery; targeted advertising can reach users without buying space from a newspaper; video platforms and creator ecosystems compete for attention; mobile operating systems and app stores mediate access; and cloud, data and AI capabilities raise the technology requirements for media organizations. In Vietnam, these structural changes coincide with rapid internet adoption and formal national efforts to accelerate press digital transformation (Prime Minister of Vietnam, 2023).

The research hypothesis is: H1 - Traditional press in Vietnam is hard to compete with the big four GAFA (Google, Amazon, Facebook/Meta and Apple). The phrase 'hard to compete' is operationalized as a structural competitive disadvantage rather than an assertion that Vietnamese press has no viable future. Competition is examined across five dimensions: (1) audience access, (2) advertising and monetization growth, (3) data and targeting capability, (4) control of distribution infrastructure, and (5) organizational capability to transform. Traditional press retains important strengths - original reporting, local knowledge, institutional legitimacy and direct editorial responsibility - but the hypothesis concerns whether the economic and technological conditions make direct competition with global platforms difficult.

1.1 Research questions

- RQ1: Does audience and internet data show that digital platforms can access audiences at a scale comparable with Vietnam's national media market?
- RQ2: How did selected GAFA monetization indicators change during 2021-2025?
- RQ3: Did Vietnam's digital advertising market grow while traditional media revenues weakened?
- RQ4: Do the indicators jointly support the hypothesis of structural competitive disadvantage?
- RQ5: What alternative explanations and limitations must be considered before drawing conclusions?

1.2 Study period

The main period is 2021-2025 because it captures the most recent five-year phase specified in the assignment and includes the acceleration of mobile, video, creator and AI-driven media. Traditional-media administrative revenue is available here for 2022-2024, so those comparisons use a shorter overlapping window. Different definitions and reporting systems are kept separate rather than merged into one market-share statistic.

2. Literature and Analytical Framework

2.1 Platformization and the loss of distribution scarcity

Platformization provides the theoretical background for the hypothesis. Helmond (2015) describes platforms as infrastructures that extend their technical and economic logic across the web. Nielsen and Fletcher (2023) show that platforms have become important gateways to information, although their importance for news varies across countries. For traditional press, the competitive issue is that digital distribution is not neutral. Search ranking, recommendation, social sharing, app stores and ad systems influence which content becomes visible and how value is captured. Publishers may reach large audiences through platforms, but they do not fully control the rules of discovery or the data generated by those interactions.

2.2 From audience commodity to datafied audience

Advertising-supported media have always sold access to audiences, but digital platforms can offer far more granular targeting, measurement and automated optimization. Willig (2022) describes a media economy in which audiences are increasingly transformed into data points that can be segmented and traded through digital infrastructure. This is a significant competitive difference. A newspaper can know its subscribers and website visitors; a large platform can potentially observe behavior across search, video, social interaction, commerce, devices or apps and use those signals to improve recommendation and advertising. The value of this capability is visible in the rapid growth of platform advertising revenues.

2.3 Traditional press still has differentiated assets

The hypothesis should not be interpreted as saying that platforms and press produce identical products. Journalism creates verified information, public-interest reporting, investigative work and locally accountable editorial decisions. Platforms primarily organize access, interaction, advertising and infrastructure, although they also fund and distribute professional content. This distinction means competition occurs over attention, advertising, data and distribution rather than only over the production of journalism itself. A sustainable strategy for traditional press therefore does not require matching GAFA in global scale; it requires converting distinctive editorial value into direct audience relationships and diversified revenue.

2.4 Expected empirical pattern

If the hypothesis is consistent with the data, several directional patterns should appear together: high digital-platform reach in Vietnam; strong growth of GAFA monetization; growth of digital advertising; contraction or slower growth in traditional media revenue; and evidence that many press organizations still face digital-capability gaps. No single indicator is decisive. The research logic is triangulation across independent measurements. This avoids pretending that a three-year revenue series can produce a reliable causal regression or that global GAFA financial statements directly measure their revenue from Vietnam.

3. Data and Quantitative Methods

3.1 Data sources

The analysis combines several source types. Vietnam internet users and platform advertising-reach indicators come from DataReportal's annual country reports, which compile data from multiple providers and platform advertising tools (Kemp, 2021, 2022, 2023, 2024, 2025). GAFA financial indicators come from company filings with the U.S. Securities and Exchange Commission: Alphabet's Google advertising revenue, Meta advertising revenue, Amazon advertising services, and Apple Services revenue (Alphabet Inc., 2026; Amazon.com, Inc., 2026; Apple Inc., 2025; Meta Platforms, Inc., 2026). Apple Services is not a pure advertising measure and is therefore interpreted separately as ecosystem monetization.

Vietnam digital advertising market estimates are taken from the same commercial series used in Practice 1, while press and broadcasting revenue figures follow the Vietnamese media-sector evidence summarized in that report. The 2024 digital maturity distribution is drawn from the Authority of Press assessment reported by the Ministry of Information and Communications and Vietnam News Agency (Ministry of Information and Communications, 2024; Vietnam News Agency, 2024). Commercial estimates and administrative statistics are explicitly labeled because they use different definitions.

3.2 Quantitative techniques

Technique	Formula / rule	Purpose
Absolute change	Latest - initial	Show increase or decrease in original units
Percentage change	(Latest / initial - 1) x 100	Compare cumulative growth or contraction
CAGR	(Latest / initial)^(1/n) - 1	Summarize average annual growth over multiple years
Index number	Year / base year x 100	Compare series with different absolute scale
Reach ratio	Platform ad reach / internet users	Contextualize potential platform scale
Directional triangulation	Compare signs across independent indicators	Evaluate whether evidence is jointly consistent with H1

3.3 Interpretation rules

Four rules prevent overstatement. First, platform ad reach is not the same as monthly active users. Second, global GAFA revenue does not equal Vietnamese revenue. Third, Apple Services includes the App Store, cloud, content, payments and advertising, so it should not be compared as if it were only advertising. Fourth, simultaneous digital-ad growth and traditional-media decline show structural divergence but not a one-variable causal relationship. Macroeconomic conditions, audience preference, competition from TikTok and local platforms, organizational strategy and policy also matter.

4. Audience Scale and the Digital Market Context

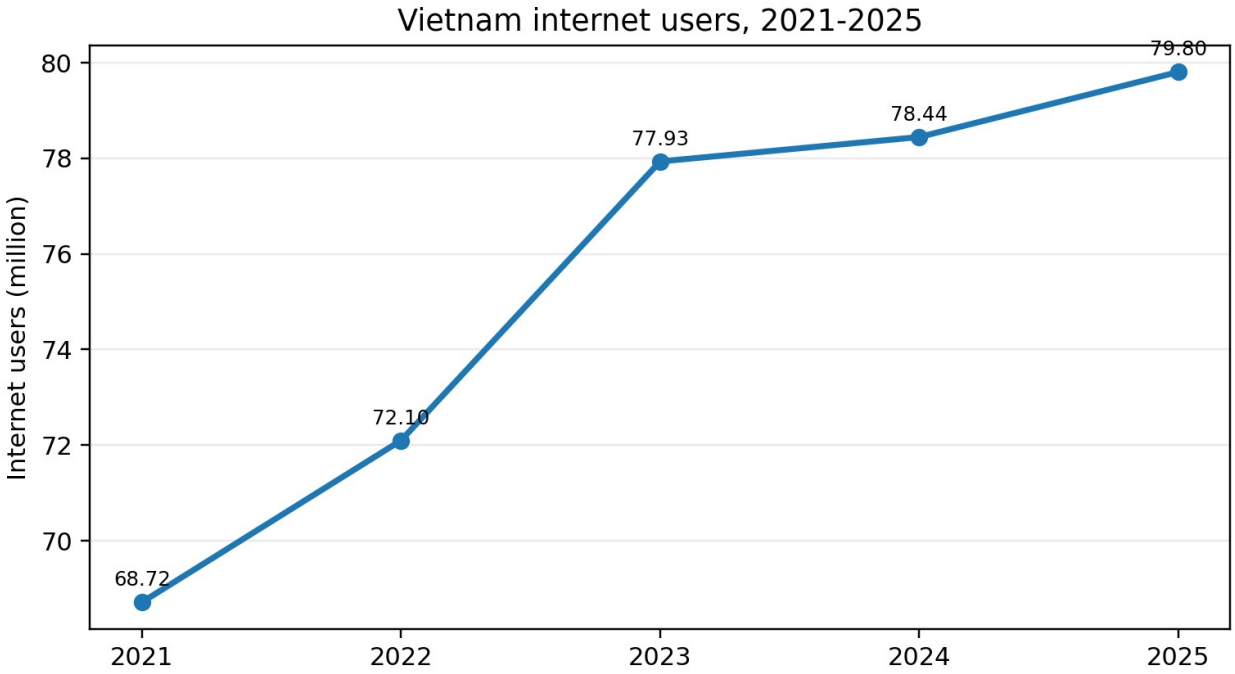

Figure 1. Vietnam internet users, 2021-2025.

Source: Kemp (2021, 2022, 2023, 2024, 2025).

Vietnam's internet user base increased from 68.72 million in January 2021 to 79.8 million in January 2025. This is an increase of 11.08 million users, or 16.1% over four years, equivalent to a CAGR of approximately 3.8%. Internet penetration rose from 70.3% to 78.8%, although the annual series contains revisions and should not be interpreted as perfectly continuous. The strategic meaning is clear: digital distribution is a mass-market condition rather than a niche supplement to traditional channels (Kemp, 2021, 2025).

4.1 Platform reach relative to the internet population

In early 2025, Meta's advertising tools indicated potential Facebook reach of 76.2 million users in Vietnam, while Google's advertising resources indicated YouTube reach of 62.3 million. Relative to DataReportal's 79.8 million internet-user estimate, these figures are equivalent to approximately 95.4% and 78.1% respectively. These ratios must be treated cautiously because the numerator is advertising reach and the denominator is an internet-user estimate, but they demonstrate the national scale at which platforms can connect advertisers and content to users (Kemp, 2025).

4.2 Why scale matters for competition

Scale produces several advantages. Large platforms can spread fixed technology costs across many markets, run continuous experiments on recommendation and advertising, and offer advertisers unified tools for targeting, measurement and optimization. A Vietnamese newspaper may have strong reach within a valuable audience segment, but it cannot easily reproduce the cross-service identity data, automated auction systems or global engineering investment of GAFA. The implication is not that the platform audience is always more valuable; it is that the platform can make buying access to that audience easier and more measurable for advertisers.

Indicator	2021	2025	Change
Vietnam internet users	68.72m	79.80m	+16.1%
Internet penetration	70.3%	78.8%	+8.5 percentage points
Facebook potential ad reach	Not used for trend due method changes	76.2m	95.4% of 2025 internet-user estimate
YouTube potential ad reach	Not used for trend due method changes	62.3m	78.1% of 2025 internet-user estimate

5. Quantitative Analysis of GAFA Roles and Monetization

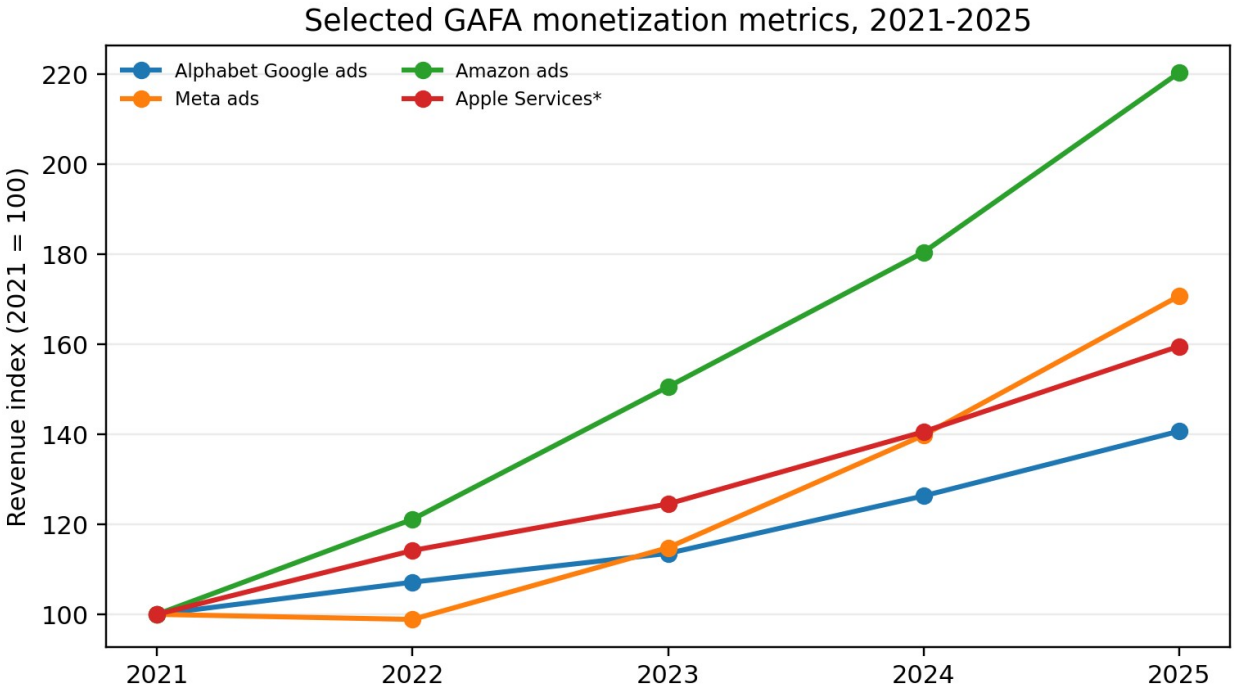

Figure 2. Growth of selected GAFA monetization indicators, indexed to 2021 = 100.

Source: Company annual reports and SEC filings. Apple Services is broader than advertising.

From 2021 to 2025, Alphabet's Google advertising revenue increased from US$209.5 billion to US$294.7 billion (+40.7%; CAGR about 8.9%). Meta advertising revenue rose from US$114.9 billion to US$196.2 billion (+70.7%; CAGR about 14.3%). Amazon advertising services more than doubled, from US$31.2 billion to US$68.6 billion (+120.3%; CAGR about 21.8%). Apple Services increased from US$68.4 billion to US$109.2 billion (+59.5%; CAGR about 12.4%), although this category includes multiple services beyond advertising (Alphabet Inc., 2026; Amazon.com, Inc., 2026; Apple Inc., 2025; Meta Platforms, Inc., 2026).

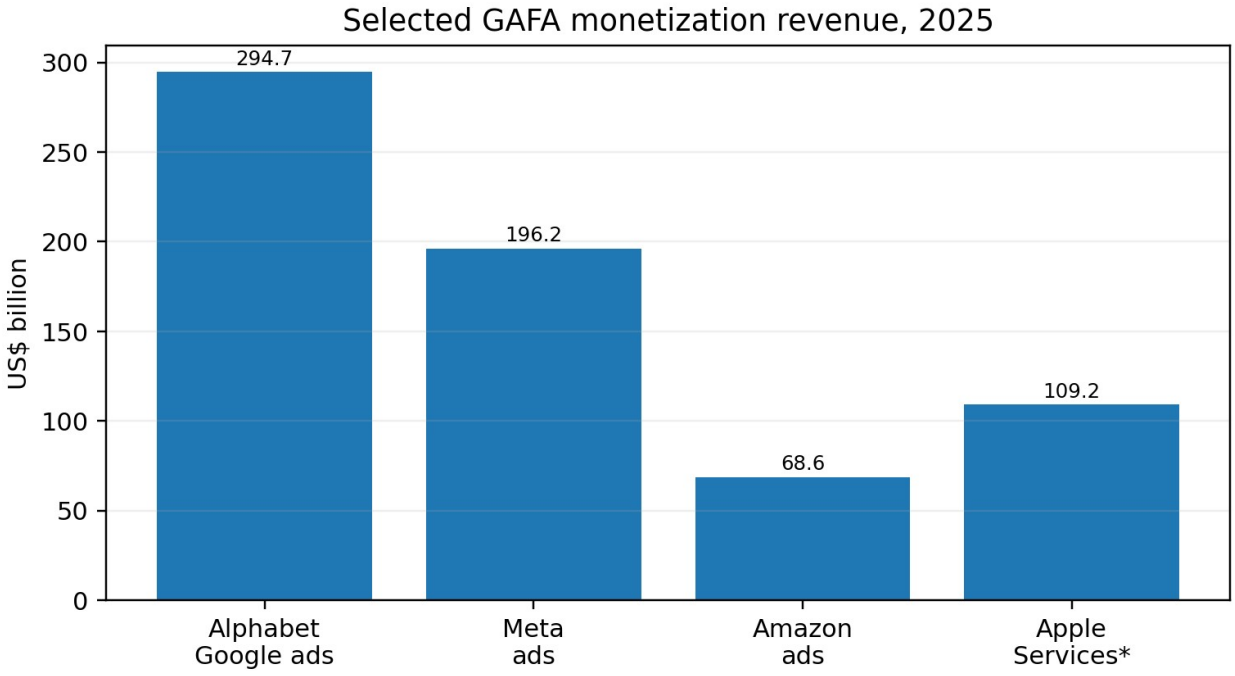

Figure 3. Selected GAFA monetization scale in 2025.

Source: Alphabet Inc. (2026), Meta Platforms, Inc. (2026), Amazon.com, Inc. (2026), and Apple Inc. (2025). *Apple Services is not directly comparable with advertising-only categories.

5.1 Google and Meta: direct pressure on discovery and advertising

Google and Meta are the most directly comparable with traditional press in the advertising and audience-discovery layers. Alphabet reported US$294.7 billion in Google advertising revenue in 2025, including US$224.5 billion from Search and other properties and US$40.4 billion from YouTube ads. Meta reported US$196.2 billion in advertising revenue in 2025 and explained that growth came from both more ad impressions and higher average price per ad, supported by targeting and measurement improvements (Alphabet Inc., 2026; Meta Platforms, Inc., 2026). The relevance for Vietnam is structural: the same core advertising systems are available to Vietnamese advertisers, even though the global revenue totals should not be interpreted as Vietnam-specific sales.

5.2 Amazon and Apple: broader ecosystem competition

Amazon's competitive role is increasingly connected to commerce media, streaming and infrastructure. Its advertising services revenue reached US$68.6 billion in 2025, while AWS and subscription services add additional ecosystem power (Amazon.com, Inc., 2026). Apple competes through a different mechanism. Services revenue reached US$109.2 billion in fiscal 2025, with the company identifying growth in advertising, the App Store and cloud services (Apple Inc., 2025). These businesses show that media competition now extends beyond the sale of ad space. It includes devices, app distribution, subscriptions, cloud infrastructure, payment systems, creator tools and commerce data.

6. Vietnam Digital Advertising versus Traditional Media Economics

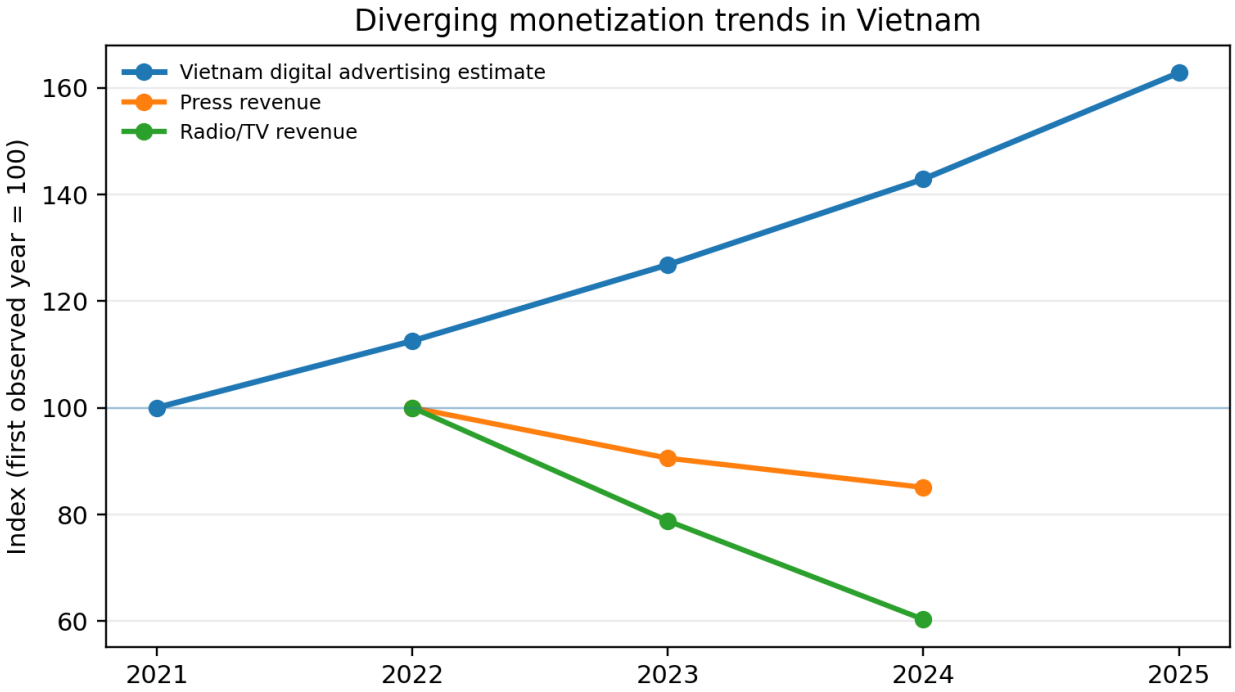

Figure 4. Diverging monetization trends: digital advertising estimate versus traditional media revenue indexes.

Source: Digital-ad series: commercial market estimate used in Practice 1. Traditional media: Vietnamese sector revenue data used in Practice 1. Series have different units, so index numbers are shown.

The estimated Vietnamese digital advertising market increased from US$903 million in 2021 to US$1.47 billion in 2025. The cumulative increase is 62.8%, equivalent to a CAGR of approximately 13.0%. The series therefore indicates sustained double-digit expansion over the period. This growth is consistent with a shift toward channels where advertisers can target audiences, measure response and optimize campaigns rapidly. It does not mean every digital advertising dollar goes to GAFA, because local publishers, ad networks, e-commerce platforms, TikTok and other services also compete for spending.

6.1 Traditional press and broadcasting revenue contraction

Over the available 2022-2024 period, total revenue reported for newspapers and magazines fell from VND9,500 billion to VND8,080 billion, a decrease of 14.9%. Radio and television revenue fell from VND15,158 billion to VND9,140 billion, a decrease of 39.7%. These are total sector revenue measures rather than advertising-only series, so they should not be subtracted directly from the digital-ad estimate. The value of the comparison is directional: a rapidly expanding digital advertising environment coincided with contraction in important legacy-media revenue pools.

Series	Start	End	Cumulative change	Average annual rate
Vietnam digital advertising estimate	US$903m (2021)	US$1.47bn (2025)	+62.8%	~13.0% CAGR
Newspapers & magazines total revenue	VND9,500bn (2022)	VND8,080bn (2024)	-14.9%	~ -7.8% CAGR
Radio & television total revenue	VND15,158bn (2022)	VND9,140bn (2024)	-39.7%	~ -22.3% CAGR

6.2 Why the divergence is economically important

Traditional press faces a two-sided problem. On the revenue side, advertisers can move budgets toward digital systems that offer targeting and performance measurement. On the cost side, publishers must increase spending on technology, video, data, cybersecurity, AI and digital talent simply to remain competitive. This creates a margin squeeze: legacy revenue can weaken while transformation costs rise. The policy goal of developing new revenue sources in Vietnam's press digital-transformation strategy reflects this challenge (Prime Minister of Vietnam, 2023).

7. Hypothesis Evaluation

Audience access	Facebook ad reach 76.2m; YouTube 62.3m (2025)
Ad-market direction	Estimated digital ad market +62.8% (2021-25)
Platform monetization	GAFA selected metrics +40.7% to +120.3% (2021-25)
Legacy economics	Press -14.9%; radio/TV -39.7% (2022-24)
Capability gap	38.7% of assessed press agencies rated poor in 2024

Interpretation: the indicators are directionally consistent with a structural competitive disadvantage, but aggregate secondary data do not establish that platform growth alone caused every decline in traditional press.

Figure 5. Five quantitative indicators used to evaluate H1.

Source: Author calculations from DataReportal, company filings, Vietnam media revenue evidence, and the 2024 digital maturity assessment.

7.1 Dimension 1 - audience access

The platform reach evidence is consistent with H1. Facebook and YouTube can offer advertisers and content producers access to audiences on a national scale, and they operate inside daily communication and entertainment routines. Traditional outlets can also reach millions of users, but most do so individually and with less cross-market identity data. The key competitive difference is therefore not simply the number of people reached; it is the combination of reach, behavioral signals, automated buying and recommendation.

7.2 Dimension 2 - monetization growth

The GAFA financial series shows strong capacity to expand monetization. Amazon advertising services recorded the fastest relative growth in this comparison, while Meta and Alphabet also expanded from much larger bases. Apple Services grew strongly through an ecosystem that includes the App Store, content, cloud and advertising. These figures demonstrate the scale of capital and recurring cash generation available for further investment in AI, infrastructure, product development and acquisition of attention. Vietnamese press organizations operate under fundamentally different resource conditions.

7.3 Dimension 3 - advertising-market direction

The Vietnamese digital-ad estimate rose by 62.8% between 2021 and 2025. At the same time, available traditional press and broadcasting revenue declined from 2022 to 2024. The divergence is consistent with the proposition that advertisers increasingly value digital channels. It cannot identify the exact share captured by each global platform, but it creates a market environment in which platform companies have a structural advantage because advertising is integrated with data, audience identity, recommendation and automated delivery.

7.4 Dimension 4 - infrastructure and data control

This dimension is partly quantitative and partly structural. Alphabet, Meta, Amazon and Apple operate at scales that allow continuous investment in cloud infrastructure, AI, ad technology, video delivery, app ecosystems and measurement. The 2025 company reports show hundreds of billions of dollars in revenue across these ecosystems. A traditional newspaper normally controls its editorial content and owned properties, but it may depend on external search, social, video, mobile and ad infrastructures to reach users. That dependence makes competition asymmetrical even when the publisher has high-quality content.

7.5 Dimension 5 - organizational capability

The 2024 press digital-transformation maturity assessment found that 109 of 282 participating agencies, or 38.7%, were rated poor; only 28, or 9.9%, were rated excellent (Vietnam News Agency, 2024). This does not mean the entire industry is digitally weak - participating agencies represented a large share of readership and advertising activity - but it shows

substantial variation in strategy, infrastructure, organizational alignment, audience capabilities and technology. A market in which many outlets are still building foundational capabilities is difficult terrain for competing with global technology ecosystems.

Evidence dimension	Observed indicator	Interpretation for H1
Audience access	Facebook 76.2m and YouTube 62.3m potential ad reach in 2025	Platforms operate at national audience scale.
GAFA monetization	Selected metrics grew +40.7% to +120.3% from 2021-25	Large and expanding resources support technology investment.
Vietnam digital advertising	Estimated market +62.8% from 2021-25	Advertising value is moving toward measurable digital channels.
Legacy media economics	Press -14.9%; radio/TV -39.7% from 2022-24	Traditional revenue pools are under pressure.
Digital capability	38.7% of assessed agencies rated poor in 2024	Transformation is progressing but remains uneven.

8. Discussion: What the Data Can and Cannot Prove

8.1 The evidence is consistent, but causality is multi-factor

The five dimensions all point toward structural difficulty for traditional press, so the hypothesis is well supported as a descriptive market proposition. However, it would be too strong to conclude that GAFA growth mechanically caused every decline in Vietnamese media revenue. Advertising demand changes with the economy; television faces competition from non-GAFA streaming and social platforms; print circulation may decline because of changing preferences; local e-commerce and messaging platforms also capture attention; and organizational decisions inside media companies affect performance. A causal study would need outlet-level or advertiser-level data, a longer time series and a research design capable of isolating effects.

8.2 Competition is asymmetric rather than identical

Traditional press and GAFA are not identical producers. Newspapers invest in journalism; the platforms mainly organize discovery, interaction, infrastructure and monetization. Competition is therefore asymmetric. A publisher may depend on Google Search for discovery while also competing with Google for advertising budgets; it may use Facebook for distribution while losing direct data about users; it may publish video on YouTube while sharing monetization and accepting platform rules. This dual relationship - partner and competitor - is a defining characteristic of platformized media markets.

8.3 Why local editorial value still matters

The competitive disadvantage does not eliminate strategic options. Traditional press has assets that platforms usually do not create themselves: verified local reporting, subject expertise, archives, source relationships, accountability and recognized editorial brands. These assets can support subscription, membership, events, specialized information services, licensing, branded products and direct advertiser relationships. The strategic problem is how to connect distinctive content to data, product design and direct audience relationships so that value is not captured entirely at the distribution layer.

8.4 Relationship to the qualitative findings from Practice 2

The quantitative evidence aligns with the qualitative account of changing audiences and newsroom transformation. Audience behavior shifts toward mobile, on-demand and platform-mediated discovery; platforms integrate content with data and monetization; and Vietnamese newsrooms are investing in multimedia, analytics and AI. The two methods answer different questions. Quantitative analysis establishes scale and direction, while qualitative analysis explains mechanisms, organizational responses and the meaning of dependency. Together they provide a stronger basis for a final mixed-method assessment.

9. Strategic Implications for Traditional Press in Vietnam

9.1 Compete on differentiated value, not global scale

A Vietnamese news organization cannot sensibly attempt to match GAFA's engineering budget or global user base. A more realistic strategy is to compete where editorial and local advantages are strongest: trustworthy reporting, specialist verticals, local communities, exclusive databases, service journalism and high-value professional information. The objective is to make the publisher indispensable to a defined audience rather than merely large in generic traffic.

9.2 Build first-party data and direct relationships

Registration, newsletters, mobile apps, memberships, web push, events and subscriber services allow publishers to learn about users directly and create repeat habits. This does not require abandoning platforms; it changes their role from destination to acquisition channel. A healthy distribution portfolio uses search, social and video to reach new users but continuously converts some of that reach into direct relationships that the newsroom controls.

9.3 Diversify revenue

Advertising will remain important, but dependence on display advertising alone is increasingly risky. Revenue can be diversified through subscriptions, memberships, events, research products, content licensing, branded content with clear disclosure, video and podcast sponsorship, training, archives and specialized B2B services. The appropriate mix will differ by outlet. The principle is to align revenue with distinctive audience value rather than competing only for commodity impressions.

9.4 Make technology a newsroom capability

Digital transformation should be treated as organizational capability rather than a temporary project. Editorial, product, engineering, data, commercial and legal teams need shared goals and governance. AI can help with transcription, translation, summarization, personalization and production, but its value should be measured in quality, time saved, audience outcomes and revenue - not adoption for its own sake. Cybersecurity, data protection, copyright and human editorial review should be built into the workflow.

9.5 Measure the right indicators

Traffic is not sufficient. News organizations should monitor direct visits, registered users, newsletter retention, subscription conversion, time spent, repeat frequency, revenue per user, advertiser retention and the proportion of traffic dependent on any single platform. These measures reveal whether digital transformation is strengthening the publisher's own market position rather than simply generating more platform activity.

10. Conclusion

The hypothesis that traditional press in Vietnam is hard to compete with GAFA is supported by a coherent set of quantitative indicators. Vietnam's digital audience expanded to nearly 80 million internet users; Facebook and YouTube offered advertising reach at national scale; selected GAFA monetization metrics grew strongly between 2021 and 2025; the estimated Vietnamese digital advertising market expanded by almost two-thirds; traditional press and broadcasting revenue contracted over the available 2022-2024 period; and a substantial share of assessed press organizations remained at low digital-maturity levels. These patterns describe a market in which platform companies possess substantial advantages in scale, data, advertising technology and infrastructure.

The conclusion should be stated carefully. The evidence does not prove that GAFA is the sole cause of traditional media decline, nor does it imply that journalism has no competitive strengths. It shows that direct competition for attention and advertising takes place under unequal technological and economic conditions. The most sustainable response is therefore not to imitate global platforms in every function, but to combine high-value journalism with direct audience relationships, first-party data, diversified revenue, platform-aware distribution and disciplined investment in product and technology.

For a final graded research paper, the next methodological step would be to add outlet-level observations. A dataset containing traffic sources, digital revenue share, platform follower reach, subscription activity and digital-maturity indicators across Vietnamese media organizations could support correlation or regression. Interviews with editors and advertising managers could then explain the causal mechanisms behind the statistical relationships. Such a mixed-method design would move the argument from a strong descriptive market analysis toward a more rigorous explanation of competitive performance.

Appendix A. Core Quantitative Data

A1. Vietnam internet users

Year	Internet users (million)	Penetration
2021	68.72	70.3%
2022	72.10	73.2%
2023	77.93	79.1%
2024	78.44	79.1%
2025	79.80	78.8%

A2. Selected GAFA monetization metrics (US$ billion)

Year	Alphabet ads	Meta ads	Amazon ads	Apple Services*
2021	209.497	114.934	31.160	68.425
2022	224.473	113.642	37.739	78.129
2023	237.855	131.948	46.906	85.200
2024	264.590	160.633	56.214	96.169
2025	294.691	196.175	68.635	109.158

A3. Vietnam digital advertising market estimate

Year	Market size (US$ million)	Index (2021=100)
2021	903	100.0
2022	1,016	112.5
2023	1,145	126.8
2024	1,290	142.9
2025	1,470	162.8

A4. Traditional media revenue

Year	Newspapers & magazines (VND bn)	Radio & television (VND bn)
2022	9,500	15,158
2023	8,600	11,939
2024	8,080	9,140

A5. Example calculations

Vietnam internet-user growth = (79.80 / 68.72 - 1) x 100 = 16.1%.

Vietnam digital-advertising CAGR = (1,470 / 903)^(1/4) - 1 = approximately 13.0% per year.

Press revenue change, 2022-2024 = (8,080 / 9,500 - 1) x 100 = -14.9%.

Radio/TV revenue change, 2022-2024 = (9,140 / 15,158 - 1) x 100 = -39.7%.

Facebook potential ad reach / internet users in 2025 = 76.2 / 79.8 = approximately 95.4%; this is a contextual ratio, not a unique-user market share.
