# Learning Launch Plan

**CONCEPT NAME:** Campus Study Space Finder

**EXPERIMENT #** 1

## Critical Assumptions to Test

What you hope to learn

- Students will check availability before walking to a study space.
- Recent occupancy/noise data will be trusted.
- A simple reservation option will reduce wasted searching.

## Timeframe

5 days (Mon-Fri)
2 sessions per day
10-15 min per participant
Lead: Nguyen Minh Anh

**Sample Size** 12 students

## Experiment Design

How will you conduct research to test your assumptions? What prototype (or prototypes) will you use? What will happen during the experiment?

Use a clickable mobile prototype with search, filters, live occupancy, and seat reservation. Give each participant the task: "Find a quiet place near the library for the next 60 minutes and reserve a seat." Ask them to think aloud while we record time, taps, errors, and questions. Then show one stale-data scenario and one no-seat scenario. Finish with a short interview about trust, usefulness, and what they would change.

## Who

Research participants and where you will find them

12 undergraduate and graduate students recruited at the library and student center; mix of solo and group-study users.

## Tracked Metrics

Data to be recorded during the test

Task completion; time; taps; filter use; reservation choice; trust rating (1-5); confusion points; comments.

## What to Watch for

Confirming data

CONFIRMING
- 10/12+ complete in under 2 min.
- Average trust rating is 4/5 or higher.
- 8/12+ choose to reserve.
- Few errors or repeated questions.

Disconfirming data

DISCONFIRMING
- Fewer than 8/12 complete the task.
- Trust rating is below 3.5/5.
- Users ignore filters or live data.
- Most prefer walking around instead of reserving.
