Project Title

Campus Study Space Finder - Nguyen Minh Anh

Insights and Design Criteria

Insights	Design Criteria
Students lose study time walking to spaces that turn out to be full.	Show current occupancy before the student leaves for the location.
Quietness matters as much as seat availability, especially before exams.	Let users filter by noise level and preferred study type.
Students trust status updates more when they include a recent timestamp.	Display when occupancy and noise status were last verified.
Solo and group study needs are different; one list cannot serve everyone.	Support filters for solo, group, outlets, rooms, and accessibility.
Students avoid tools that take longer than checking a nearby room themselves.	Help users find a suitable space in three taps or fewer.
Reservations help only when no-shows are handled fairly and quickly.	Hold a reserved seat briefly, then release it automatically after a no-show.
